Explosion Hazards and Evaluation (Fundamental Studies in Engineering)

By W. E. Baker, P. A. Cox, J. J. Kulesz, R. A. Strehlow, P. S. Westine

Explosion Hazards and Evaluation presents the principles and applications of explosion hazards evaluation.

The text is organized into nine chapters. Chapters 1 and 2 discuss the energy release processes which generate accidental explosions, and the resulting development of pressure and shock waves in a surrounding atmosphere. The manner in which the "free-field" waves are modified in interacting with structures or other objects in their paths is discussed in Chapter 3. Structural response to blast loading and non-penetrating impact is covered in two chapters, with Chapter 4 including simplified analysis methods and Chapter 5 including numerical methods. Chapter 6 includes a rather comprehensive treatment of generation of fragments and missiles in explosions, and the flight and effects of impact of these objects. Chapter 7 considers thermal radiation of large chemical explosions. Explosions may or may not cause damage or casualty, and various damage criteria have been developed for structures, vehicles, and people. These criteria are presented in Chapter 8. General procedures for both the postmortem evaluation of accidental explosions and for design for blast and impact resistance are reviewed in Chapter 9.

Engineers, scientists, and plant safety personnel will find the book very useful.

Editorial Review

Review

The book follows a well respected series of lecture courses on explosion hazards and a series of reports and work books on explosions by the same authors. The lecture notes are prized possessions and the work books not always easily available, so the appearance of this new text fills a gap in the bookshelf. -- *Journal of Occupational Accidents*
